

Review of the Didactic Unit

From Earth to the Universe: Greetings, Sounds and Music

The Didactic Unit "From Earth to the Universe: Greetings, Sounds and Music" raises the knowledge of the importance of artistic production of human beings. The significance of what makes humanity unrepeatable is seen in the sending of information intended for those who could inhabit an unknown universe. Voyager I and II probes were launched into space in 1977 with expressions of peace, sounds and noises from the terrestrial world and, of course, with music.

This unit aims to provoke curiosity in the students. It not only informs them of the sound production sent from Earth, in recognition of who we were and are. Their active participation in the elaboration of a new, and undoubtedly updated, musical and sound information to share with those who can listen to us is also sought. In this way, they become responsible for selecting the cultural expression of the individual present on planet Earth, to be included in a space journey of discovery and communication. Hence its title, "From Earth to the Universe".
